Title : The Influence of Peat and Peat-Manure Composts on the Increase in the Productivity of Agricultural Crops in Western District of Ukraine.

Orig Pub : V sb. Nauko. i tekhn. vyd. UkrSSR, Kiev, AN UkrSSR, 1957, 121 p.

Abstract : Peat was introduced during autumn plowing in doses of 20 t/ha. It increased the yield of oats from 24 to 31 c/ha on Chernozem soil. The potato crop increased from 160.3 up to 189.6 c/ha with the introduction of peat-manure compost, consisting of 75% peat and 25% manure. The optimum time of composting is 6-7 days.

TITLE: Physical and chemical changes in animal food products in the course of refrigeration and freezing in relation to hygienic defects

SOURCE: Veterinarstvi, no. 4, 1966, 170-174

TOPIC TAGS: food technology, food sanitation, food product machinery, freezing, refrigeration, protein, cell physiology

ABSTRACT: Physical changes in animal food products in the process of refrigeration and freezing are discussed. This area is less studied than corresponding changes in plant foodstuffs. These changes have a decisive effect on the quality of meat preserved by refrigeration and freezing. Understanding these changes can speed development of the most advantageous method for preserving animal food products at low temperatures. As a rule, the best method, technologically speaking, is also the best method from the point of view of economy and hygiene. In Czechoslovakia air is normally used as the heat-transfer and refrigerating medium. The relation of the dimensions and surface area of the

Card 1/2

piece of meat to be frozen to the evaporation rate, the effect of very low temperatures on enzymatic processes, and the loss in weight due to refrigeration and freezing are discussed. It is pointed out that fatty tissue is the most resistant to atmospheric oxygen as a refrigerant. [11]

TITLE: Possibilities of spreading hoof and mouth disease through meat products

SOURCE: Veterinarstvi, no. 10, 1965, 472-475

TOPIC TAGS: virus, hoof and mouth disease, disease control, epidemiology, processed animal product

ABSTRACT: The article reviews what is known about the possibilities and dangers of spreading hoof and mouth disease through meat products which carry the virus from animals infected with the disease before being slaughtered. This type of contagion is the most important epidemiological factor in the spread of hoof and mouth disease. Data on the occurrence and stability of the virus in the flesh and organs of animals slaughtered for meat in experimental animals are not simple because the survival of the virus is affected by a number of factors. The article discusses the published data at some length and also discusses factors and conditions to be considered in storing meat. Orig. art. has: 1 table.

INFLUENCE of TEMPERATURE and HEATING PERIOD on the REMOVAL of RESIDUAL STRESSES in AUSTENTIC STEELS. L. A. Gilkman and V. P. Tekht. (Kototurbocentr, 1948, No. 2, pp. 12-16 (in Russian) (Abstract) Centre national de la Recherche Scientifique, Bulletin Analytique, 1949, vol. 10, No. 2, p. 1164). Residual stresses were created in austenitic 16% chromium 8% nickel steel by quenching in water from 1050°C. The influence of tempering temperature in the range 600-850°C. Similar treatment for other austenitic steels is recommended.

Ed. (Title page): A.A. Metallin, Professor; Ed. (Inside book): G.M. Aron; Tech. Ed.:  
S.D. Vodolagin.

PURPOSE: This collection of articles is intended for technical personnel in the  
machine-building industry and for students in schools of higher technical education.

COVERAGE: The collection contains articles on the problems of developing methods for  
mechanical machining (such as grinding and superfinishing with strain hardening,  
roll burnishing, fine grinding, etc.) which would serve to increase the life of  
machined parts exposed to friction and wear; and theory (such as productivity  
and economy). Methods for determining residual stresses (only in aircraft engines  
and aircrafts) are discussed in detail. Also considered are the possibility

of using hydrostatically activated slide rests to increase production, the use of the  
group machining method, and an attachment for process control of an existing  
lathe which would not necessitate modification of the lathe. A description  
of advanced production methods and work planning used in plants of the German  
Democratic Republic is presented. No personnel are mentioned. References  
accompany most of the articles.

TITLE: The improved model of the РВТД (РВТД) radar-altimeter

SOURCE: Moscow. Tsentral'nyy nauchno-issledovatel'skiy institut geodezii, aeros"yemki i kartografii. Trudy. no. 146. 1962, Issledovaniya po fotogrammetrii, 17 - 22

TEXT: Radar-altimeters operate reliably in plain, hilly and forest regions, but in mountainous regions their functioning proved to be unsatisfactory, mainly due to insufficient power of generator of ultrahigh frequency in transmitter. In the present article the author describes a new model of modernized radar-altimeter in which the generator power was increased by a factor of 4.5 - 5. Since the circuits of the receiver and indicator remained practically unchanged, only the circuit of the radar-altimeter transmitter is described and presented in Figure 1. The generator produces oscillations of frequency  $f = 440$  Mc (wavelength  $\lambda = 68$  cm) and contains 8 tubes of 6Н15П (6N15P) type assembled according to the ring circuit. Recurrent frequency of pulses is 16,000 cps and dura- X

Card 1/3

The improved model of...

S/547/62/000/146/002/004  
A001/A101

tion is about 0.4  $\mu$ sec. The output power of the generator is about 500 w. In addition to modernization of the transmitter, sensitivity of the radar-altimeter was increased by 4 - 5 times by eliminating some losses in antennas feeders and adaptors. Of a special importance is mentioned the MAZP(MAZP) device for operations in mountainous regions. This device blocks instantaneously the receiver as soon as the first reflected signal appears on the tube screen, which eliminates a simultaneous occurrence of several reflections, possible in mountains, leading to impossibility of finding the true altitude. In 1959, GVF and TsNIIGAiK tested four specimens of the modernized radar-altimeter in mountainous, high-mountainous and plain-hilly regions. Depending on the altitude of photographing and country relief, the number of negatives containing information on altitude amounts to 70 - 100% of the whole number of negatives in mountainous regions and 100% in plain-hilly regions. It is concluded that the modernized radar-altimeter is adequate to operations also in mountainous regions. There are 5 figures and 3 tables.

TITLE: Phase relations in a tellurometer

SOURCE: Moscow. Tsentral'nyy nauchno-issledovatel'skiy institut geodezii, aeros"yemki i kartografii. Trudy. no. 146. 1962. Issledovaniya po fotogrammetrii, 147 - 152

TEXT: The new radar range finding device, tellurometer, can measure distances from 150 m to 50 km with an accuracy of  $5 \text{ cm} \pm 3 \times 10^{-6}$  on the average. Its simplified block-diagram is presented in the figure attached and the mode of operation is described in detail. The left-hand part of the figure represents the key station, A, and the right-hand part - the slave station, B. Both stations are mounted at the points between which the distance is measured. The magnitude of this distance is read off the phase indicator which yields the quantity  $2\Omega \frac{r}{v}$ , where  $r$  is distance being measured,  $v$  is velocity of radio wave propagation, and  $\Omega = 2\pi F$  is angular oscillation frequency of the modulating quartz generator of Station A. The ultra-high frequency oscillator of Station B is X

Card 1/3

S/547/62/000/146/004/004

A001/A101

Phase relations in a tellurometer

modulated by sinusoidal oscillations from the quartz generator having angular frequencies  $\Omega - \Delta\Omega$  and  $\Omega + \Delta\Omega$ , where  $\Delta\Omega = 2\pi\Delta F$ , is difference of angular frequencies of modulating oscillations at Stations A and B. It is recommended to carry out distance determination twice: one with the modulation frequency  $\Omega - \Delta\Omega$ , and the other with the frequency  $\Omega + \Delta\Omega$ ; thereby residual errors are eliminated. There is one figure.

TITLE: A sufficient condition for the stability of second order nonlinear system

SOURCE: Archiwum elektrotechniki, v. 13, no.1, 1964, 3-14

TOPIC TAGS: Automatic control, control theory, automatic control system, nonlinear control system, second order nonlinear system, control system stability, differential equation, second order differential equation

ABSTRACT: The authors previously (J. C. Gille and S. Wegrzyn, "O pewnym wystarczającym warunku stabilnosci nieliniowych układów automatyki." Automat i Telemech, Vol VII, nos 1 and 2, 1962) proposed a practical condition for nonlinear stability which was unusually simple in application. They also indicated the feasibility of defining more precisely the areas of its application. The present article attempts to do this very thing. The conditions for a second order system were determined and the proof was given. In a stable linear differential equation

$\lambda_1 \dot{x} + \lambda_2 x + \lambda_3 \dot{x} = 0$ , the coefficient  $\lambda_2$  represents the losses in the system while the coefficients  $\lambda_1$  and  $\lambda_3$  represent the retentive properties. The differ-

Card 1/3

ACCESSION NR: AP4039448

ence in these two types of coefficients is also unusually useful in the case of an analysis of nonlinear systems. The following two special cases are therefore examined in detail: (1) nonlinear second order differential equations, all the coefficients of which (losses and retentions) are the functions of the variables  $x$ ,  $\dot{x}$ , and  $\ddot{x}$ , while the coefficients of retention are constant. This type of equation was called a type of equation with nonlinear scatter. The authors proved that strict stability conditions for these two types of nonlinear equations are different. The requirements for group 1 are higher than for group 2. Authors conclude that the stability conditions derived in the above-mentioned previous study for linear static conjugate systems assures the stability of nonlinear systems provided the latter system belongs to a system type with nonlinear scattering. If the coefficients of retention are also nonlinear, then this condition should be supplemented by an additional uniqueness condition for the nonlinear coefficients. It would be of great interest if the results could be generalized for equations of high orders. Original article has: 11 figures and 21 equations.

Improved utilization of bauxite. László Gillemot. *Aluminium* (Budapest) 2, 20-32 (1980). The processing of high iron content bauxites has been found to be economical if iron and alumina-earths are produced simultaneously. The bauxite is roasted and then a magnetic separation process is applied, as a result of which an iron-enriched portion and a low iron content portion are obtained. The iron-enriched part can be directly utilized as iron ore, while the low iron content portion can be utilized to produce alumina-earths according to the Bayer process. The drying process can be dispensed with, since the ore is roasted prior to magnetic separation. The iron-enriched portion has a reduced content of slag components and is suitable for producing high-grade gray iron and steel for transformer sheet and welding rods. E. Gross

**On the Crystallization of Bimodal Graphite.** L. Gillemot, (Ontario, 1951, vol. 2, Mar., pp. 49-56; Kohászati Lapok, 1951, vol. 6, Mar.). [In Hungarian]. Experiments were carried out to study the influence of the carbon, silicon, and cerium contents, the wall thickness, and the temperature on the formation of nodular graphite in iron castings. The pouring temperature was kept at 1400° C. except when this factor was the subject of study. The results showed that nodular graphite in a ferrite-pearlite matrix can form only in a limited range of silicon and cerium contents; it is possible to obtain nodular graphite in a matrix of ferrite or pearlite plus carbide outside this silicon and cerium range. Contrary to Mykowsky and Dunphy, this author found that formation of nodular graphite depends greatly on the carbon content. The influence of annealing and heat-treatment was also investigated. The author believes nodular graphite is formed by the decomposition of undecorated carbide.

When the arc is struck with the rod held in the hand, the arc of the suspended electrode is also ignited, and the welder fills the melt of both rods into the joint. A disadvantage of this method is that the angle of inclination of the suspended electrode continually changes in relation to the joint, and, consequently, conditions of welding constantly vary. Another handicap of it is that best results have been obtained with specially coated welding rods.

Disadvantages of the method reviewed above may be eliminated if the welder holds a common welding rod with the standard electrode holder, while placing the other rod horizontally into the joint.

From the electrical point of view, twin-rod welding presents three solutions. The ideal solution is a three-phase transformer. Two single-phase transformers can be used as well, but the combination transformer-dynamo is also very suitable. Test results of the suggested improved method may be summed up as follows:

- (1) Through the observation of the principle of double-rod welding, performance can be more than doubled in relation to the ordinary method, even at the low current intensity chosen on purpose at the test.
- (2) The operation of welding is very simple; chiefly because no particular care has to be taken to remove slag or to maintain the length of the arc. Even beginners can attain thereby much better results than with common arc welding.
- (3) Tests showed a 40-60% economy in energy consumption.
- (4) Contrary to the Humboldt-Moller method, no special coating is required on the welding rods.

1/2

8337. Gillemet, L. Novel method of speeding up manual arc welding (in Russian with English, French, and German summaries). *Acta Techn. Hung. Budapest* 7, 3-4, 277-293, 1963.

Much thought has been given to boosting the output in arc welding; especially heavy plate and sections take a long time. Although shielded arc automatic welding greatly increases performance as compared to manual arc welding, it cannot be applied at present to every job. An obvious way to boost the efficiency of manual arc welding is to increase the diameter of the welding rod, but the results is not in proportion to the increase of the cross section of the filler rod; the boost in performance is, by no means linear, and speeds increase becomes less and less. Double rods (double rod welding, with a three-phase current supply, have given better results (e.g., Kael's method).

An interesting and quite different way of increasing output is the Humboldt-Meister method, in which the welder leads one filler rod with his hand while the other rod is rotatably fixed to a special stand.

HUNG.

Design and operation of reactors for titanium production.  
L. Gillemot (Tech. Univ., Budapest). *Acta Tech. Acad. Sci. Hung.* 10, 221-45 (1965) (in English).—A disassemblable reactor vessel of 3500 cc. is used consisting of a cylindrical bottom-closed steel vessel with a conically fitting lid in a resistance furnace with a gas-tight water-cooled cover. Pressure is checked with a Hg manometer.  $TiCl_4$  is pumped into the Mg-contg. reactor by means of A pressure from a calibrated glass wash-bottle; the A pressure, throughout the expt., is 70 or 115  $\pm$  15 mm. Hg higher than the reaction pressure in the vessel. The reaction pressure initially 700 mm., goes up in 8 min. to about 800 mm., then sinks after 20 min. to about 680 mm., to rise again to 880 mm. Hg after 50 min. The reaction temps. are 900, 850, or 800°. Ground reaction products are washed with 2% HCl. The higher the  $TiCl_4$  ratio fed during the process of Ti reduction the less Mg in the sponge grains. The high-Mg fraction can be recycled. The equil. pressures of the reaction have been computed by Z. Horváth (private communication) (temp. °C,  $P_{TiCl_4}$ ,  $P_{Mg}$ , mm. Hg): 777, 2.89  $\times 10^{-14}$ , 1.023; 827, 3.23  $\times 10^{-14}$ , 34.80, 2.350; 877, 3.03  $\times 10^{-14}$ , 50.30, 4.920; 927, 2.68  $\times 10^{-14}$ , 123.0, 10.01; 977, 2.04  $\times 10^{-14}$ , 209.8, 17.8. Working metallic titanium. L. Gillemot. Tetsu to koh. 1956.

18-193-1671. Optimum annealing temp. depends on the purity of the Ti and lies between 680° and the temp. of  $\alpha$ - $\beta$  transition. With Ti from the iodide process the optimum tenacity properties are obtained in the temp. range of the  $\beta$ -field and the metal is cold rolled followed by hot annealing, hot drawing or

advantage. With hard Ti hot rolling of the material at 680° is not necessary; it is however advantageous to reheat the material at 900° for 10 sec., following by cold rolling and annealing at temp. between 680° and the  $\alpha$ - $\beta$  transition temp. The cold rolling can be performed at any temp. between room and the softening temp.; higher temp. within this range may be used with advantage for obtaining products of increased dimensional stability, but with sintered bodies containing Mg impurity a temp. of + 500° must be used or cracks may appear. By suitable rolling and heat treatment a product of 17% elongation can be made from Ti of Brinell hardness 225. L. G. Weingart
